INTRODUCTION

MEDIUM DENSITY FIBREBOARD (MDF)

MDF is an engineered wood product made by breaking down hardwood or softwood residuals into wood fibres, combining it with wax and a resin binder, and forming it into panels by applying high temperature and pressure.

MDF is generally more dense than plywood. It is made up of separated fibres, but can be used as a building material similar to plywood.

HIGH DENSITY FIBREBOARD (HDF)

HDF is referred to as hardboard, a type of engineered wood product. It's made from wood fibre extracted from chips and pulped wood waste. HDF is similar to MDF but much harder and denser.

It has a much higher resistant to water and is often referred to as 'Exterior-Grade MDF'.
